Subject	Baypark to Bayfair Link (Bay Link) project. MGI Underpass - Cost Estimate Verification

1 Overview:

WSP|OPUS was requested by the NZ Transport Agency to provide a cost estimate/verification for the construction of a new underpass connecting Matapihi Road and Bayfair Shopping Centre as part of the Baypark to Bayfair Link (Bay Link) project. The existing underpass was due to be closed permanently as part of the Bay Link project. The main purpose of the new underpass is to provide an alternative and safer option for people walking or cycling to cross State Highway 2. Instead of crossing at ground level through the centre of the new Bayfair roundabout using the pedestrian crossings at the traffic lights, pedestrians and cyclists will now be able to use the new underpass once completed.

CPB Contractors have been awarded the contract to build the second, and final, phase of the project, which also includes two flyovers. The new underpass will be constructed alongside the old underpass and once the new underpass is operational the old underpass will be infilled to accommodate the weight of the new Bayfair flyover approach ramps.

The Cost Estimate and associated risk profile was based on the following information provided by CPB contractors and Beca consultants:

- 50% Design Drawings
- Pricing package information sheets (Drainage, Structural, Roading, Urban Design and Geotechnical); and
- Schedule of Quantities (SoQ).

Despite the limited information provided, the Schedule of Quantities supplied by CPB was adopted and consistently used to calculate the base cost across all pricing packages.

Uncertainty in the final design and construction programme for the project, will also result in uncertainty in the total estimate value. Therefore, in the absence of a detailed design and construction programme, the following list of assumptions were used to inform this estimate and risk profile:

- Construction duration 12 months;
- Exclusion of any programme delays (time variable costs) associated with the repair or replacement of the Chorus Fibre Cable;
- Contractor inefficiencies:
- Client instructions that could significantly extend/delay the programme;
- Potential Contractor Claims and Variations;
- No significant objections from stakeholders including Tauranga Airport;
- Natural lightwells to the main structure excluded;

- No significant geotechnical slope movements; and
- Design Assumptions as listed in each of the Pricing Packages provided.

As part of the cost estimate and verification process that was conducted on the Schedule of Quantities (SoQ), the following queries require further clarification:

- Drainage 8.37: SoQ = 1,224. Verification calculation is 1,328;
- Drainage item 2.03 listed as 1.5 to 3.0m deep. Drawing shows 3.0-4.5m deep;
- We have accepted the area of temporary sheet piling due to lack of information. The scheduled quantity appears to be appropriate as a base; and
- Gantry G04 is scheduled. The drawings show a second, G05. Clarification is required as to which, if any, of G04 and/or G05 are required in this SoQ.

Due to the level of design conducted to date, items were identified as missing from the schedule. These have been included in our estimate. Items include:

- Environmental Compliance costs;
- Allocation for temporary traffic diversions:
 - o Pavement;
 - o Drainage;
 - Lighting; and
 - Removal of aforementioned items.
- Transitions of concrete barriers: We have priced 115 to Thrie Beam transitions, Thrie to TL3 transitions and leading and trailing ends as appropriate. Alternatively TAU-11 crash cushion instead of transition to leading terminal (at six times the price);
- Non return valves in the pumping station, and
- Telemetry in the pumping station.

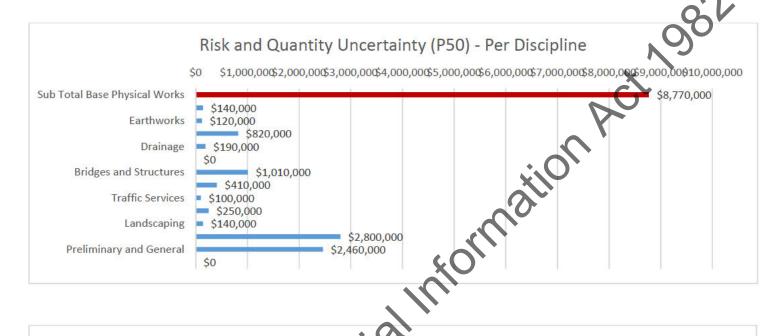

It should be noted the following costs have been excluded:

- Client related costs
- Consultancy Fees
- Design Fees
- Consent Monitoring Fee
- Property acquisition costs

2 Risks, issues and uncertainty:

Confining the risk assessment to matters outside the base estimate is unrealistic and not best practice. Therefore, the risk analysis was divided into the following subcategories, which cumulatively represent the risk profile and total risk-based contingency for the project:

- Rate and Quantity Uncertainty in base estimates; and
- Residual risks.

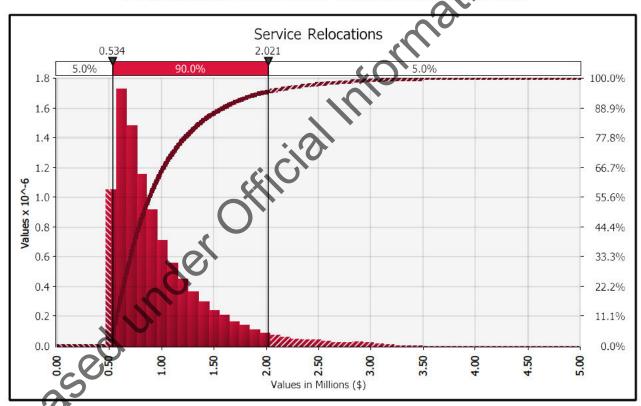

Note: The rhinor difference in the 'Sub Total Base Physical Works' totals for the above two charts are due to the rounding of values during the different calculation stages

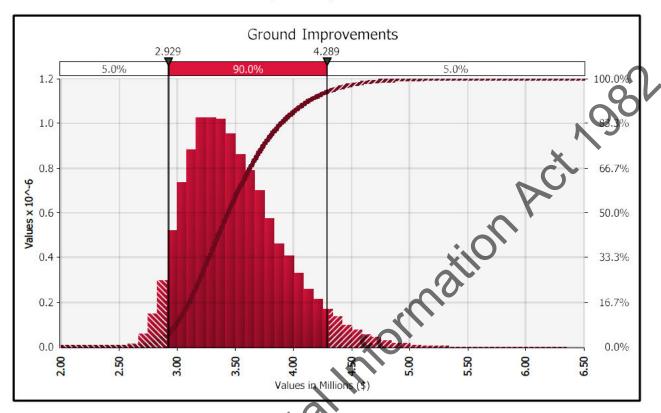

2.1 Rate and Quantity Uncertainty

From our detailed analysis, the items with the biggest variances compared to base cost can be summarized as follows. These estimates are reflective of the limited information, level of design detail completed to date, limited survey information, potential departures and Design Assumptions listed in the Pricing Packages Information sheets provided and associated with each of the individual elements of work.

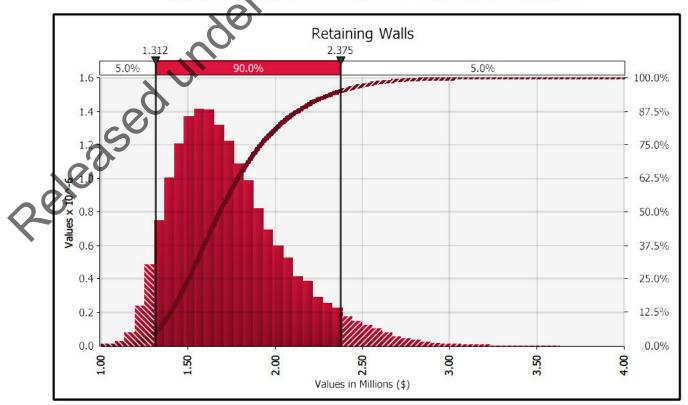

- Services:
 - Fibre
 - Diversion of 1200 pair fibre line
 - Water Mains
 - Pipe sizes: are they 200mm or 700mm watermains, temporary and permanent diversions
 - Underground Power
 - Too many joints could require a complete replacement cable

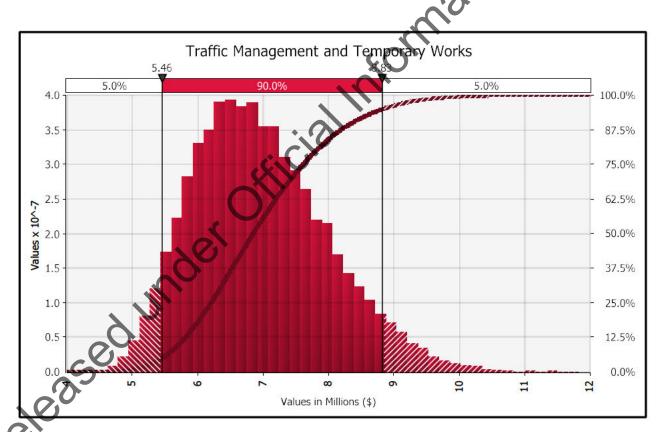

- Ground Improvements
 - Stone columns
 - Ground conditions require deeper columns.

- Retaining Walls
 - Permanent sheet piling
 - Height restrictions may cause more time intensive installation process (initial trenching, use of excavators to conduct initial driving etc.

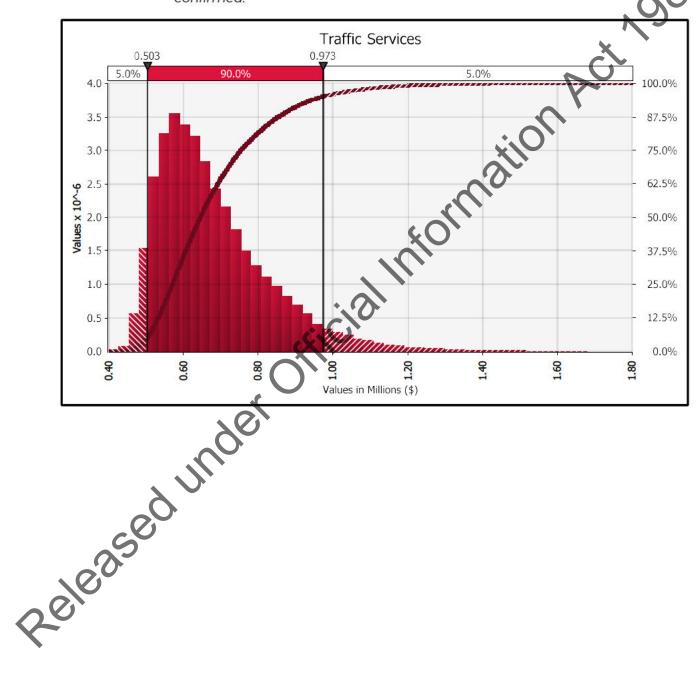

- Traffic Management and Temporary Works
 - Temporary Works
 - Only temporary works listed in the schedule as well as minor items identified as missing in the schedule have been priced. Construction methodology needs to be determined to ascertain the true cost associated with this element of the works for example but not limited to: The exact mechanism and process to connect the existing underpass with the new underpass for pedestrian transition during construction. The uncertainty associated with the value of required temporary works are estimated to be millions of dollars.
 - Sheet pile quantities, constructability and phasing uncertain.
 - o Temporary Traffic Management
 - Programme sequencing and change in regulations and standards to be confirmed.
 - Temporary pavement, drainage and lighting
 - Sequencing details to be confirmed, depth of excavations

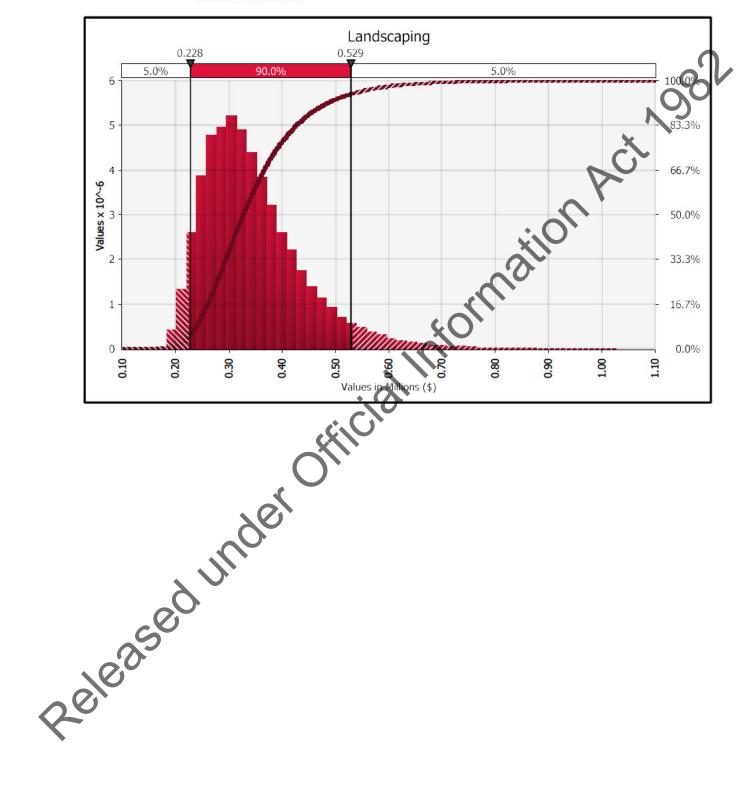

Traffic Services:

- G04 and GO5 gantries
 - Clarification required as to whether both gantries are required as part of the underpass project or whether they are only related to the main B2B construction works.
- Lighting options

Details for the underpass and ramps, especially around the hand rails to confirmed.

- Landscaping and Urban Design
 - Retaining wall relief patterning
 - Clarification on exactly what is required i.e. painted / blasted pattern vs custom moulds.

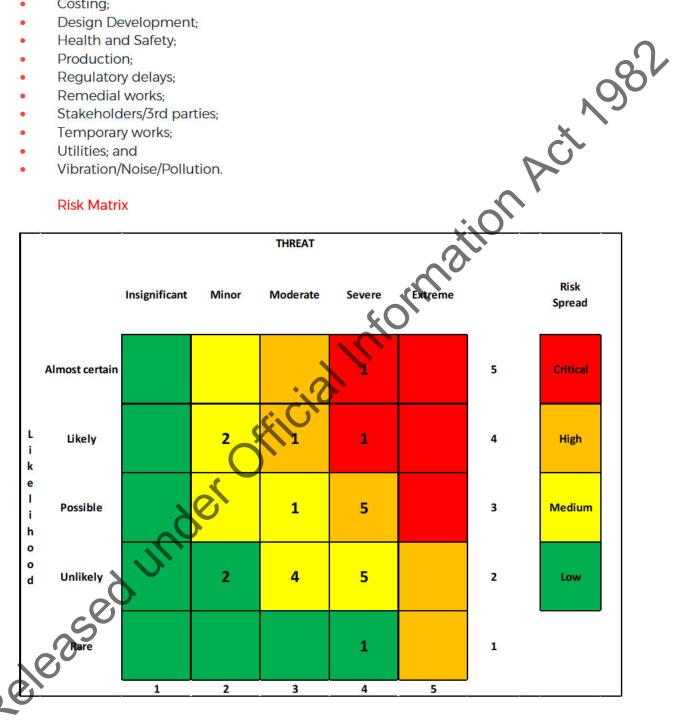

Residual Risks - Qualitative Assessment

The qualitative risk review with associated risk register was based on the following risk breakdown structure:

- Constructability;
- Costing;
- Design Development;
- Health and Safety;
- Production;
- Regulatory delays;
- Remedial works;
- Stakeholders/3rd parties;
- Temporary works;
- Utilities; and
- Vibration/Noise/Pollution.

Risk Matrix

From a qualitative risk perspective, it is evident that there is a significant amount of uncertainty associated with the following items:

- Underground utilities:
- Design Development across all packages;
- Temporary works; and
- Inefficient phasing of works.

2.3 Quantitative Assessment (Residual Risks)

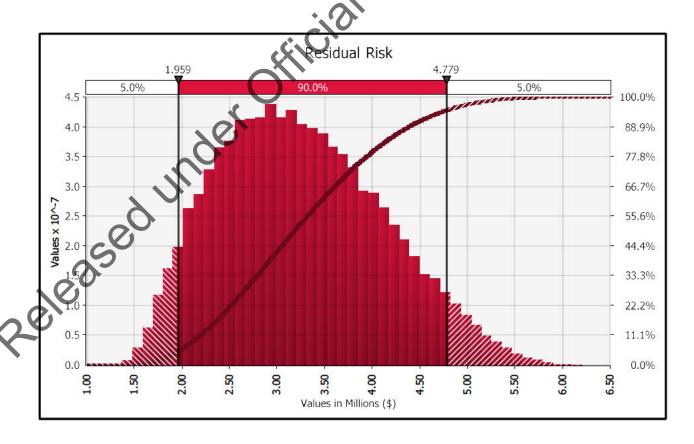

2.3.1 Schedule Delays - Time Variable Cost

A typical quantitative schedule and cost risk analysis (QCSRA) assesses uncertainty from both a direct and time variable cost perspective. Time variable delays are more complex to assess, due to the inherent correlation between time and time related costs associated with cost items such as labour, plant, equipment and overall time related overhead costs by both the contractor, client and client consultants. To fully understand and assess the time variable delay, it is critical to understand the impact of such a potential delay on the critical path of the schedule.

This is furthermore complicated by schedule logic, activity linkages, the number of activities and constraints embedded in the schedule that require specialist schedule risk assessment software such as Primavera Risk Analysis or Acumen Fuse. These software solutions carry out detailed schedule integrity checks to ensure the schedules are robust from a technical scheduling perspective, before carrying out a detailed uncertainty and opportunity analysis as identified by the project team.

Without a project schedule from CPB, time related risks can only be assessed at a high level to establish concurrency of events and therefore ignores the cumulative impact that time related risks and uncertainty could potentially have on the construction of the underpass. We therefore recommend that time related risks and opportunities are assessed in the context of concurrency, as this could undoubtedly lead to double counting and overestimation of costs.

Inevitably this may lead to over or underestimation of time related risks on the project. This is problematic from a cost and risk estimating perspective, as time related risks are typically more 'expensive' or higher value cost items. Based on the limited schedule information available the quantitative results as captured in the project risk register can be summarised as follows:

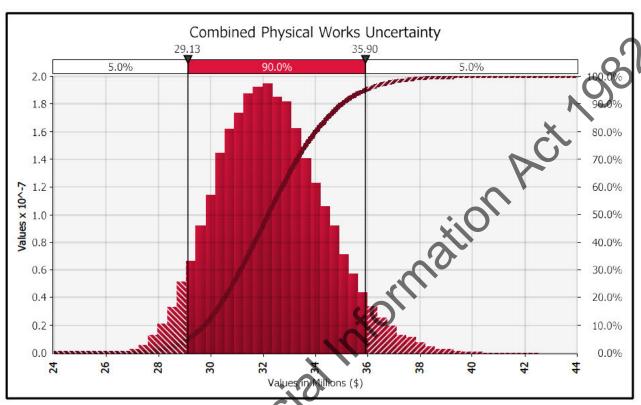

A cumulative delay of circa 3 months has been identified as part of the quantitative schedule risk analysis. This would result in additional time variable costs for contractor P&Gs, consultant and client costs.

2.3.2 Direct Cost Impacts

Direct costs are relatively easy to asses and ignores time variable cost elements such as client, contractor and consultant costs associated with risks and issues.

Based on the risks identified in the risk register the analysis produced the following results:

It is clear from the analysis that the limited information resulted in large cost uncertainty in the project.

3 Percentile Values - P5/P50/P95

3.1.1 Base/Rate and Quantity Uncertainty/Residual Risks

The base estimate is our estimate produced before project risk is considered. This provision will be integrated with a wider consideration of risk as mentioned above to understand the uncertainty in the total cost.

mantified impacts are added to the baseline costs to estimate a new, risk-adjusted, final cost. Impacts are quantified with probability distributions that, in turn, produce probability distributions of results.

Description	Base Estimate	5th %	50th %	95th %		
Total Project Cost	\$23,436,050	\$32,100,000	\$35,460,000	\$39,420,000		

Recommended 'Way Forward'

To further reduce current project cost estimation uncertainty, it is our recommendation that the following supplementary analysis, workshops and information be provided:

Released under Official Information Act 1982

Low (30%)	3. Medium	3. Medium	2. Low	6	Direct Cost: - Additional plant and labour Schedule delay: - Implementation of additional works - Contractor P&G's		
20	Threat	Drainage	Production	Potential construction inefficiencies associated with the installation of new drainage storm water pipe through golf course (675mm dia.)	Construction limited to night time working increases safety risks, methodology, and double handling	- Additional cost - Potential claims	Contractor	2. Low (30%)	3. Medium	3. Medium	2. Low	6	Schedule delay: - Implementation of the work - Contractor P&G's		
12	Threat	Design Project Wide	Design development / optimisation	Change in alignment of underpass / ramps / path / structural retaining walls / stair locations	- Regulatory (NZTA / Tauranga Airport) - Client initiated	- Significant construction delays / sequencing - Additional Design development / optimisations - Reputational damage	Contractor	1. Very Low (5%)	4. High	4. High	4. High	4	Direct Cost: - Labour and material Schedule Delays - Implementation of the works - Contractor P&G's		

Risk description:									lisk profile a		erally accepted of		and principles are in place for stage design:
ID	Туре	Risk Category	Risk Title	Risk "There is a risk"	Cause "caused by"	Consequences "If the event occurs, there will be the following consequence(s)"	Risk Owner	Likelihood (%)	Cost Impact	Schedule Impact	Reputational Impact		Assumptions applied to risk quantification / qualitative ranking
18	Threat	Drainage	Costing	Drainage pricing not properly / adequately defined	- Based on a 'previous' estimate / design	- Additional cost	Contractor	2. Low (30%)	03.w	2. Low	2. Low	4	Direct Cost: - Plant, labour and materials Schedule Delay: - Implementation of work - Contractor P&G's
19	Threat	Geotechnical	Design development / optimisation	Design development / optimisations to retaining wall displacement criteria	- Currently based on assumptions	- Redesign	Contractor	2. low (30%)	2. Low	2. Low	2. Low	4	Direct Cost: - Plant, labour and materials Schedule Delay: - Implementation of work - Contractor P&G's
