

Project overview

To make this stretch of road safer, we are:

- widening the road
- putting in a wide centreline to help separate oncoming traffic
- widening the road shoulders to give drivers more room
- putting in roadside safety barriers where there are power poles, trees and deep ditches
- making intersections safer.

Around 40km of state highway is being made safer. We've split the project into 10 sections to help limit the number of roadworks that people encounter along the highway.

Section by section, we'll locate services and move it if required, and clear trees and vegetation. In some locations, fences inside the road boundary will be relocated. Where the road is being widened, we'll remove the roadside topsoil and bring in extra material. Some drains will be installed, and chip seal will be laid. Once this is completed, safety barriers will be put in, followed by line marking, including the wide centreline. You may experience some minor delays because of the work, and we appreciate your patience.

Each section will take between 12-18 months to complete. The project is expected to be finished in 2024.

Please note: start / finish dates are indicative only due to a range of external factors.
